

Instruction to run the program :

Open Terminal and navigate to the directory where “ my_program “ is located, and then execute it with a specific input CSV file like this:

`./my_program input_test1.csv`

Replace input_test1.csv with the name of your CSV test file.

Make sure the CSV file is located in the same directory as your program or provide the full path to the CSV file.

Use different input CSV files like input_test1.csv, input_test2.csv, etc., to test the program with different scenarios.

After running the program, it will process the CSV file and create an output CSV file named "output.csv" in the same directory.
